

ETSI NFV Conference

Evolving NFV towards the Next Decade
Celebrating the 10th Anniversary of ETSI NFV

Is Mobile Networking Ready for the Serverless Revolution?

Pablo Serrano

07/03/2023

Background

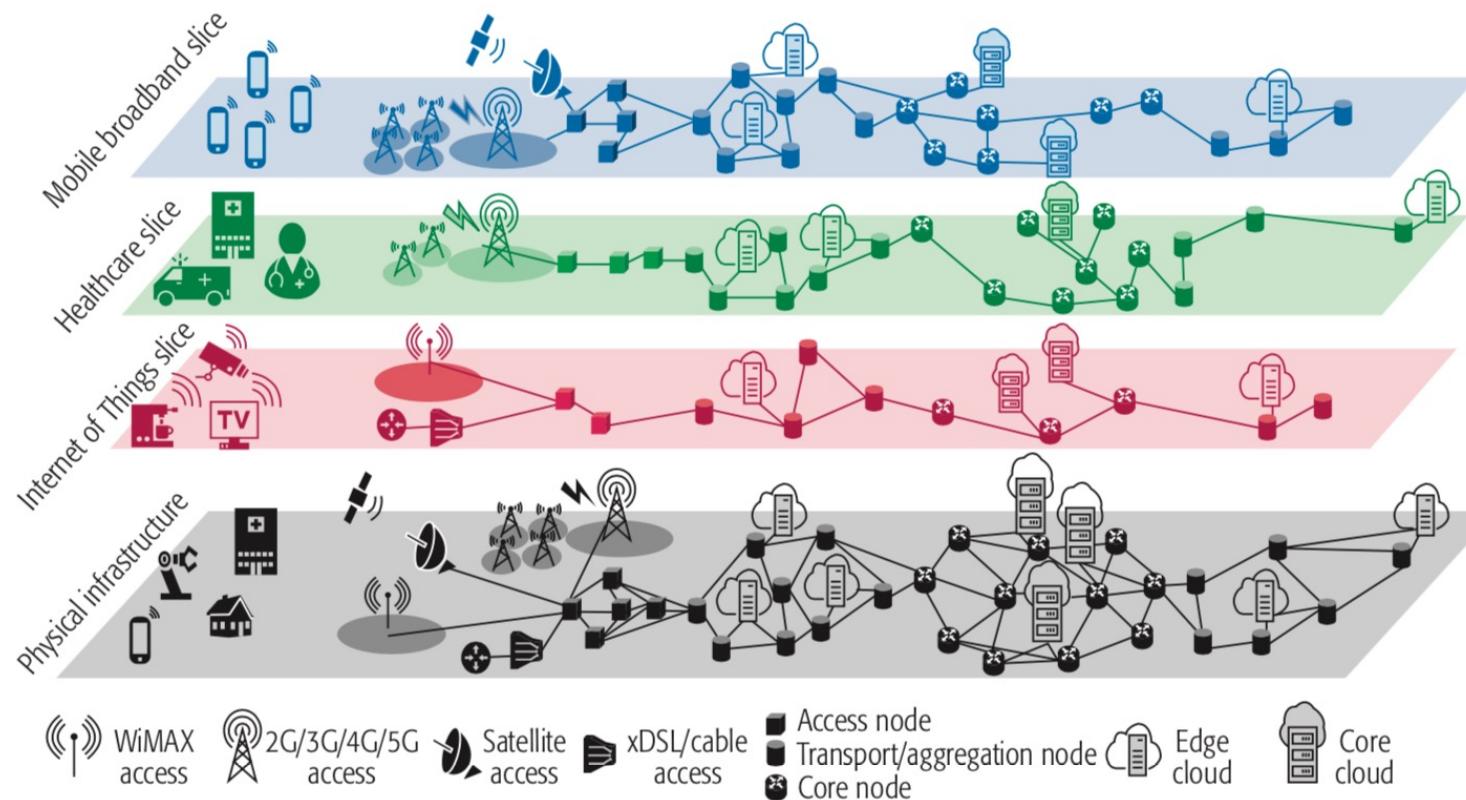

- Mobile Networking is adopting two key technologies from Computer Science
 - Softwarization
 - Modularization
- This supports several benefits
 - General-purpose hardware
 - More agility, more efficiency
- From telco engineers to software engineers

Plethora of SW projects (and papers)

- I. Gomez-Miguelez et al., “SrsLTE: An Open-Source Platform for LTE Evolution and Experimentation,” in ACM WiNTECH 2016
- F. Gringoli et al., “Performance Assessment of Open Software Platforms for 5G Prototyping”, IEEE Wir. Comm. Magazine, 2018
- N. Apostolakis et al. “Design and Validation of an Open Source Cloud Native Mobile Network”, IEEE Comm. Magazine, 2022

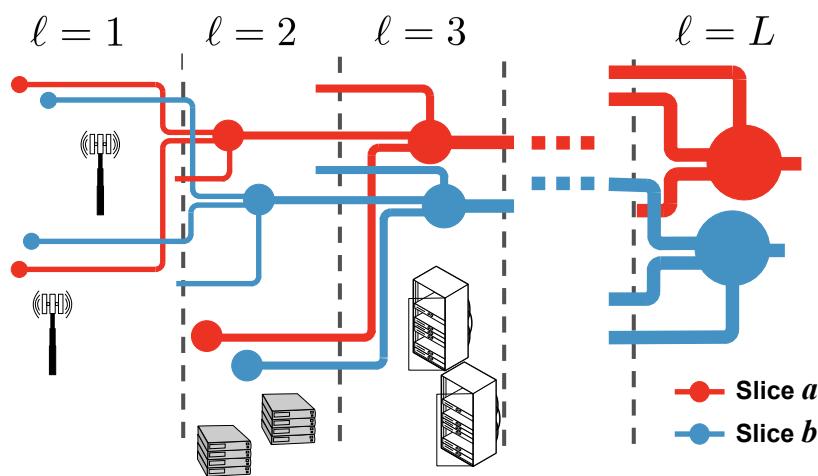

Network Slicing

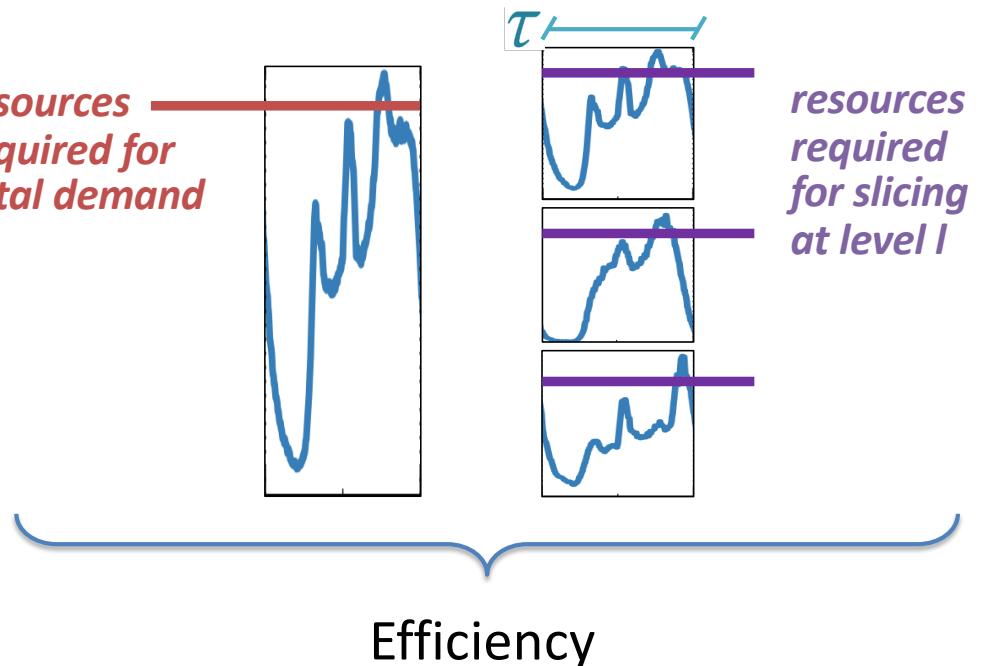

From: J. Ordóñez-Lucena et al. "Network Slicing for 5G with SDN/NFV: Concepts, Architectures, and Challenges," in *IEEE Communications Magazine*, May 2017.

The orchestration needs to be agile

- Impact of aggregation level and reconfiguration time

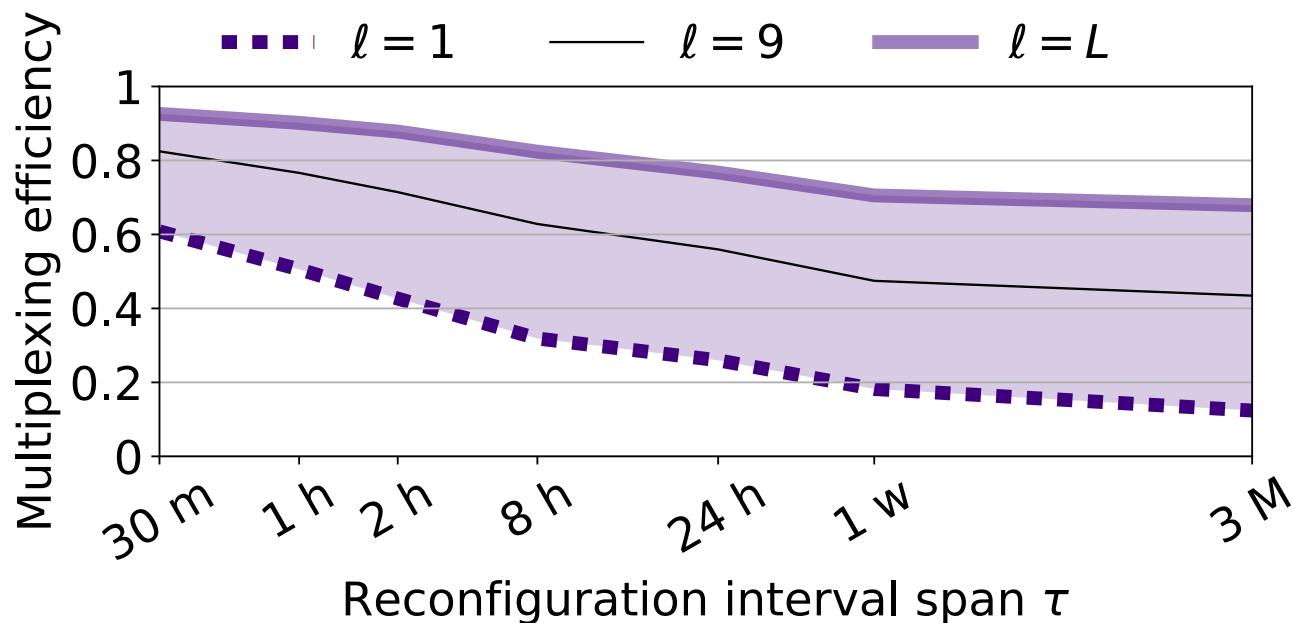

resources required for total demand

The orchestration needs to be agile

- Impact of aggregation level and reconfiguration time

Evolution of softwarization

	Single Server PNF	
Architecture	■	
Re-Configuration Re-Orchestration Frequency	Years	
Orchestration Complexity	Low	

From PNF to VNF

	Single Server PNF	Multi-tier VNF	
Architecture			
Re-Configuration Re-Orchestration Frequency	Years	 VM / NFV	Months
Orchestration Complexity	Low	Moderate	

Cloud Native

	Single Server PNF	Multi-tier VNF	Microservices H. Modular VNFs	
Architecture				
Re-Configuration Re-Orchestration Frequency	Years	Months	Cloud Native	Many times per day
Orchestration Complexity	Low	Moderate		High

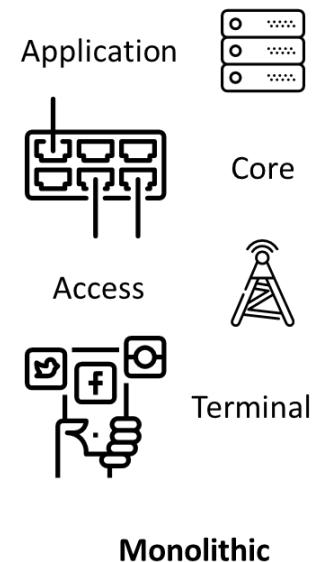

Function as a Service (Faas)

	Single Server PNF	Multi-tier VNF	Microservices H. Modular VNFs	Serverless
Architecture				
Re-Configuration Re-Orchestration Frequency	Years	Months	Many times per day	
Orchestration Complexity	Low	Moderate	High	Very High

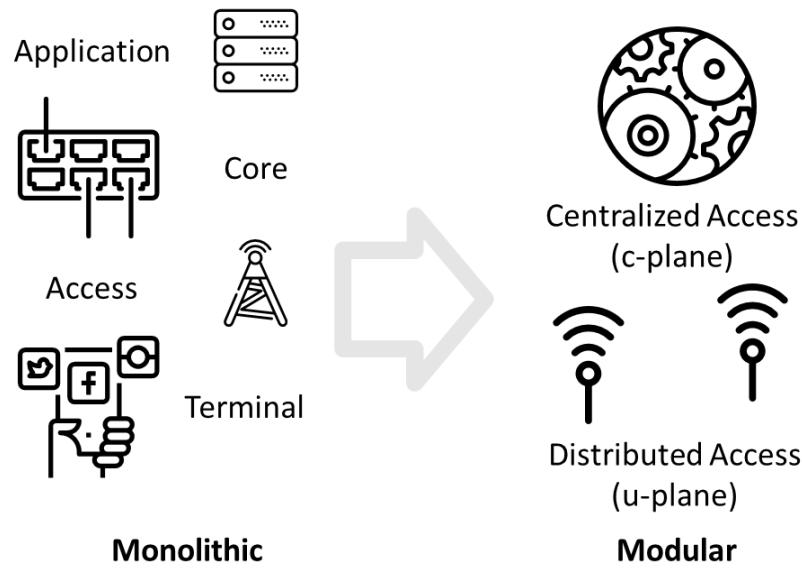

Mobile Networking

	Single Server PNF	Multi-tier VNF	Microservices H. Modular VNFs	Serverless
Architecture				
Re-Configuration Re-Orchestration Frequency	Years	Months	Many times per day	Continuous
Orchestration Complexity	Low	Moderate	High	Very High

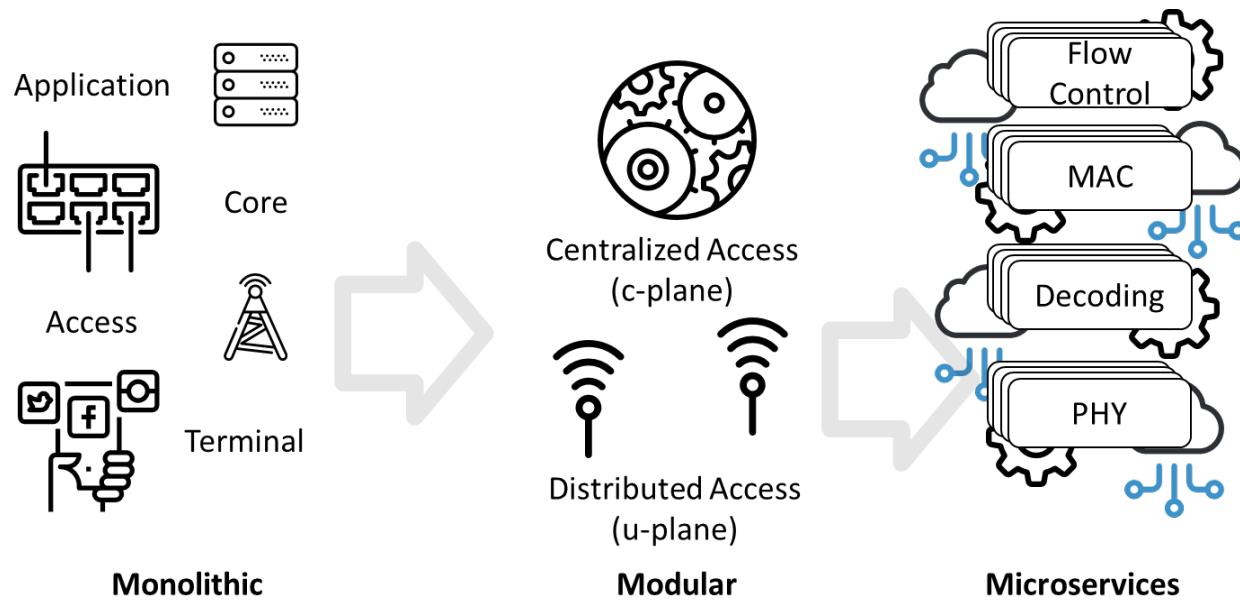

Serverless Radio Access Network

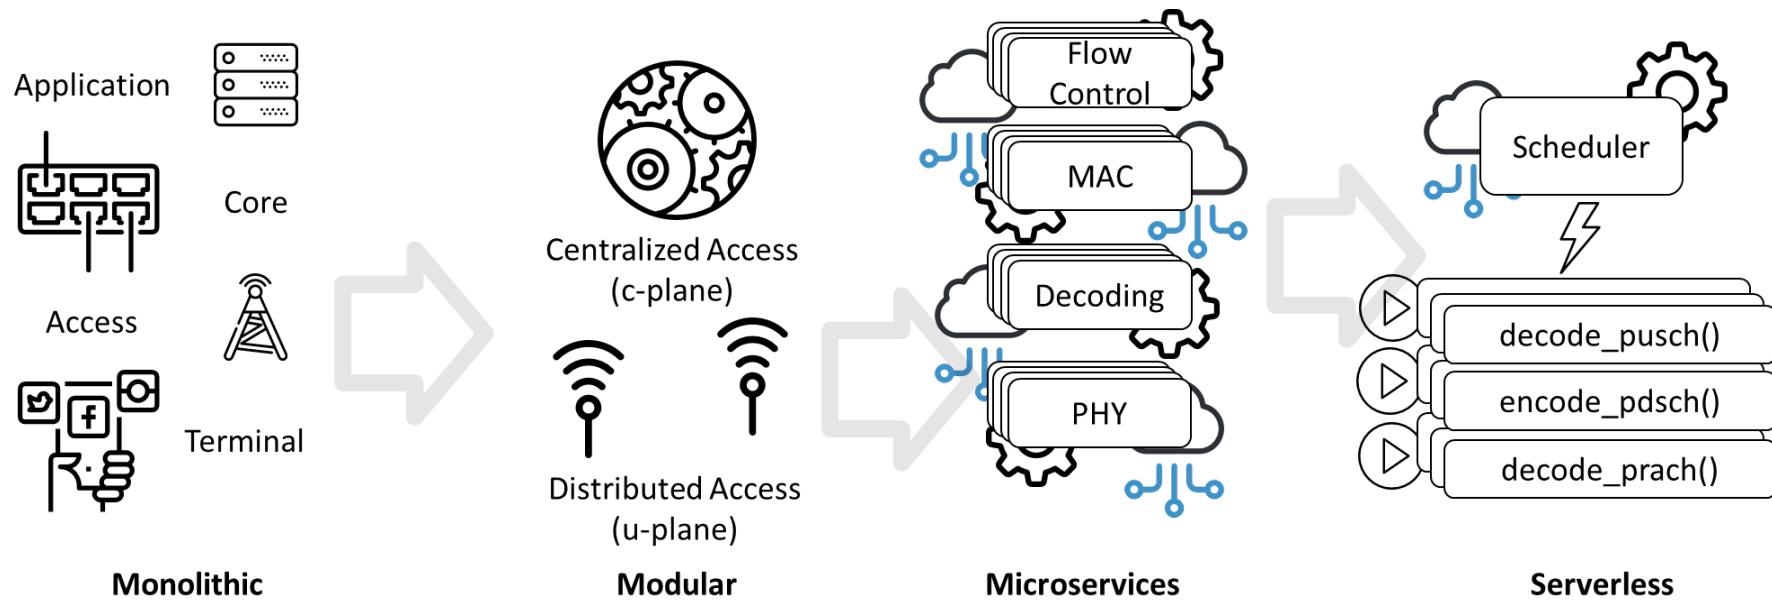

Serverless Radio Access Network

Serverless Radio Access Network

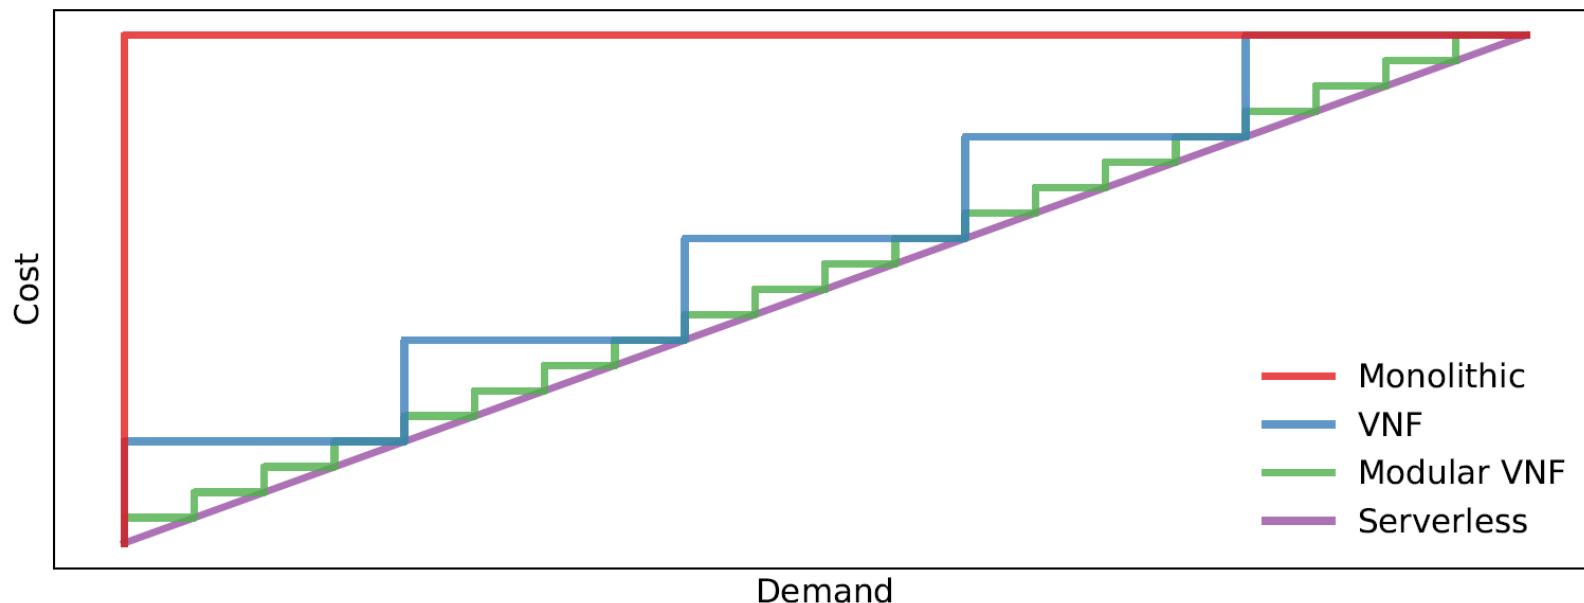

Serverless Radio Access Network

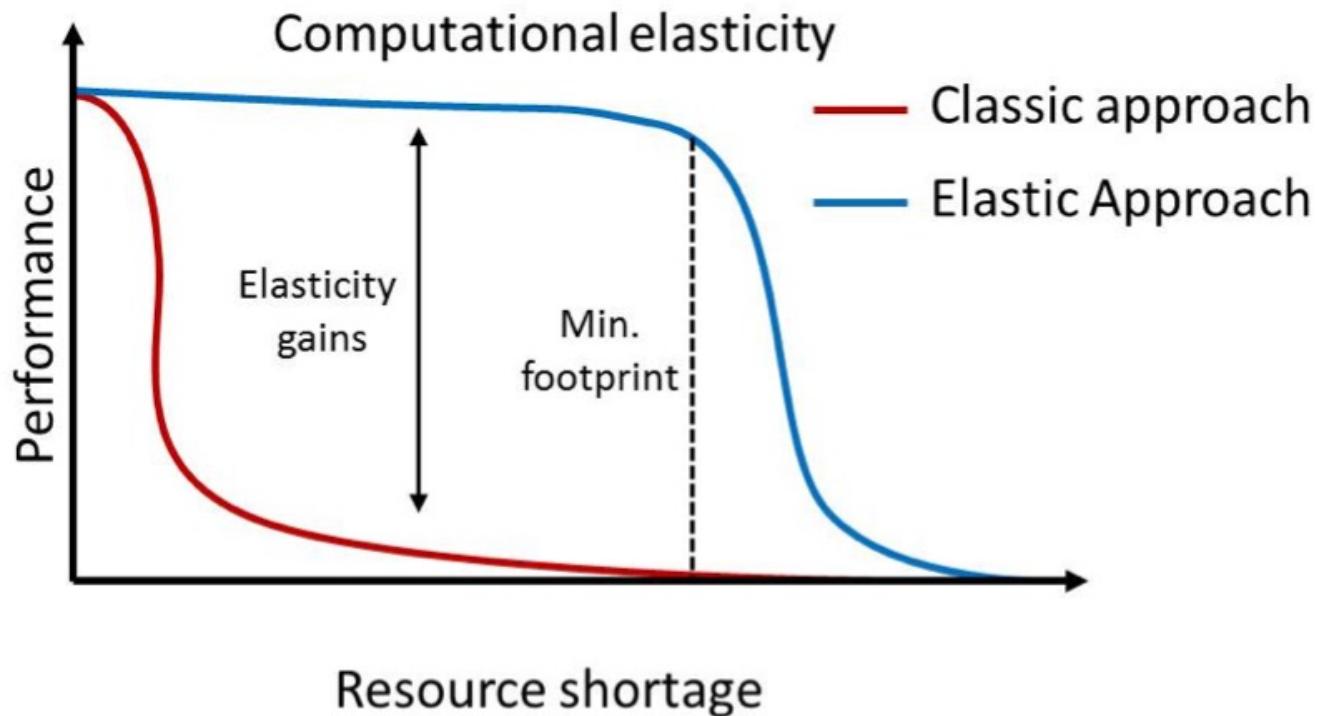

Advantages

- Scalability

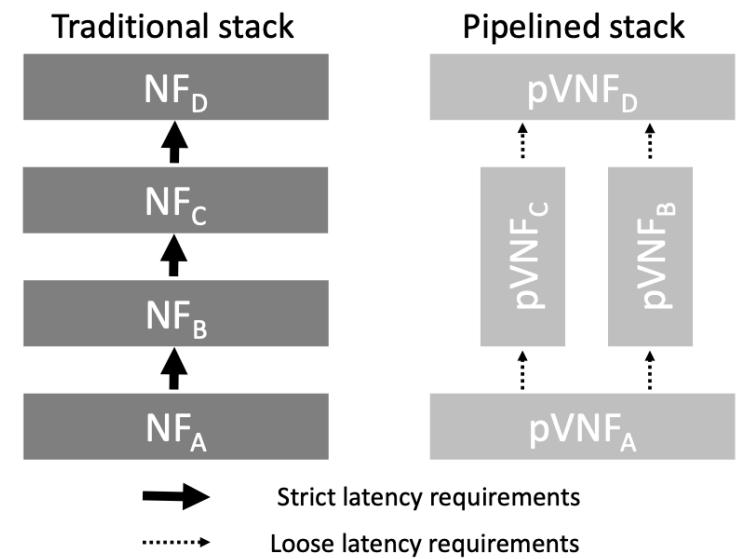

Advantages

- Elasticity

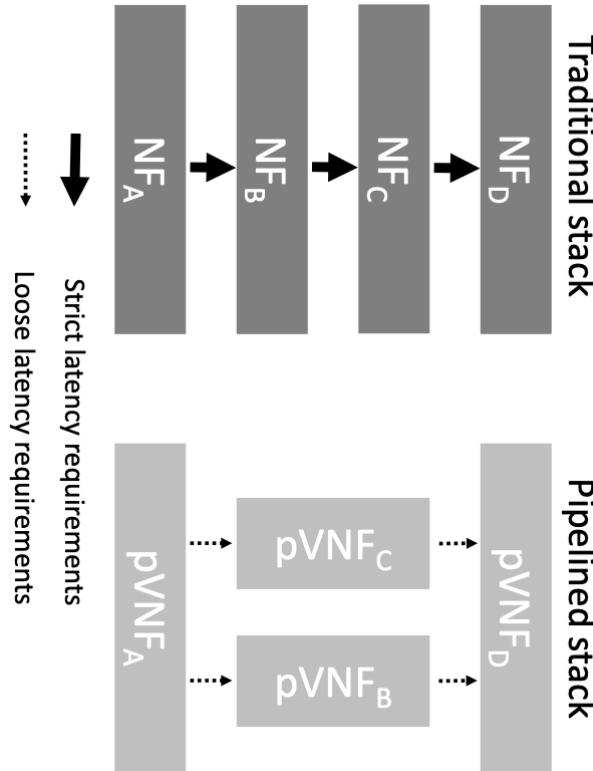

Challenges (1/3)

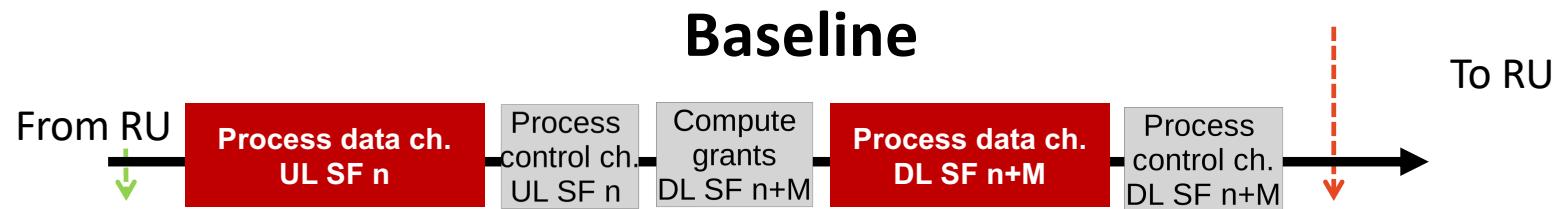

- Need to re-design VNFs
- Current RAN functions
 - High load on the CPU
 - Stringent timing requirements
- New functions
 - Lessen requirements
 - Resource-aware execution

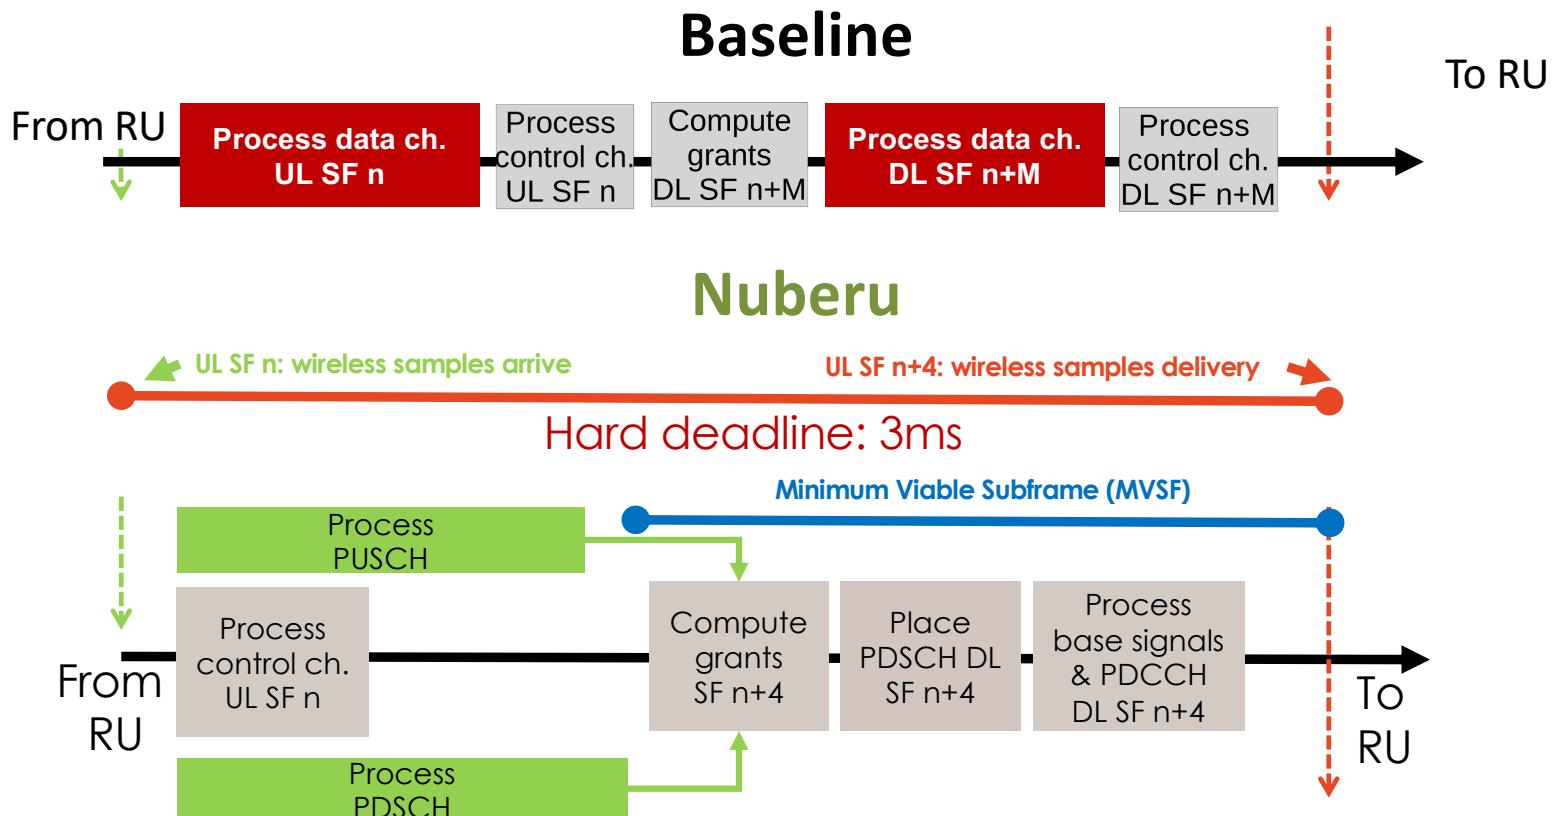

Addressing Challenge 1: Nuberu

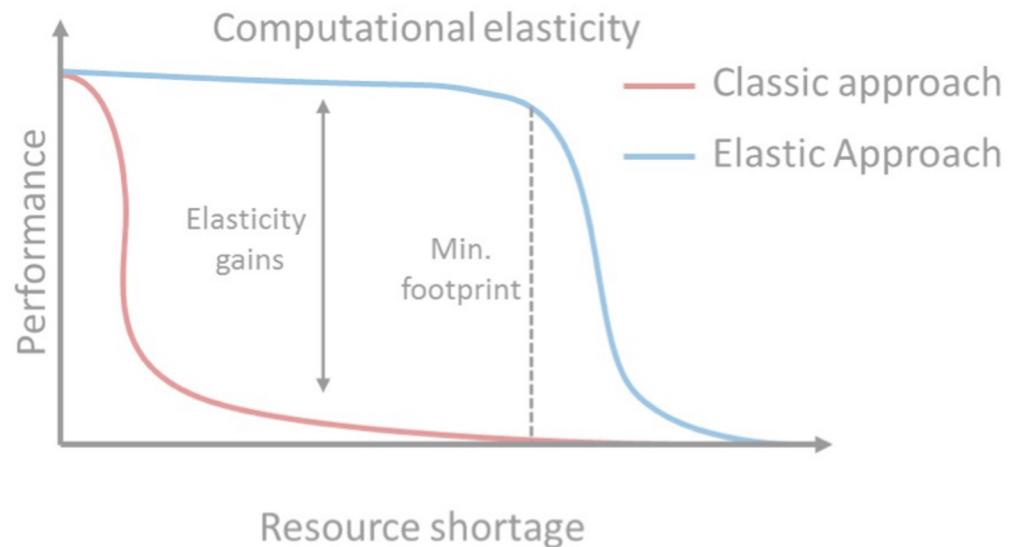

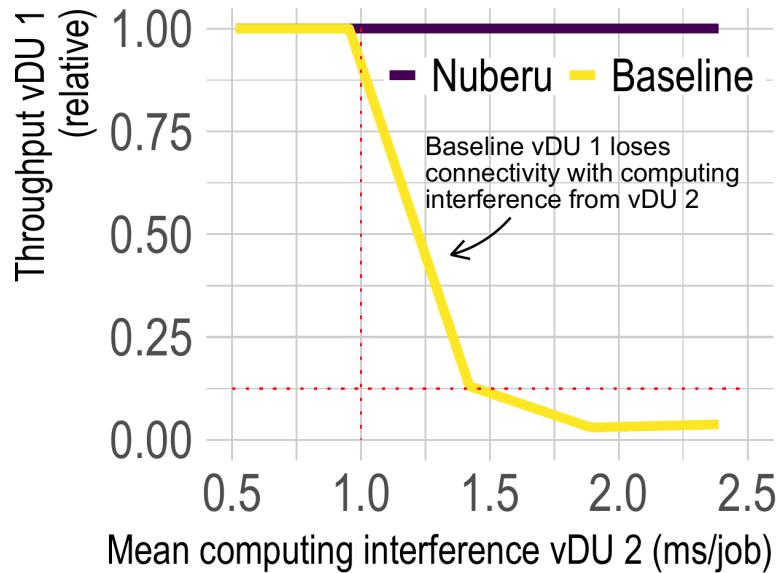

Addressing Challenge 1: Nuberu

Addressing Challenge 1: Nuberu

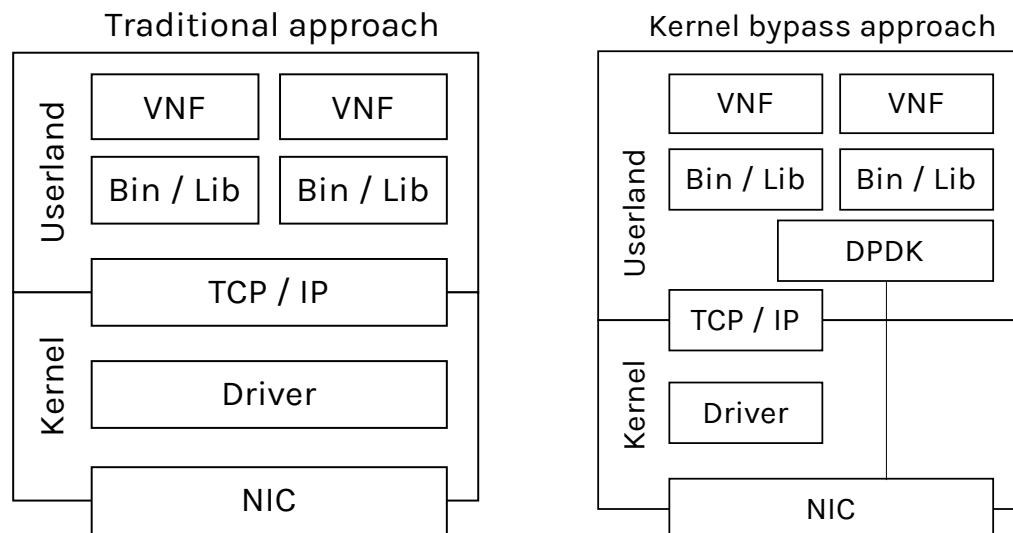

Addressing Challenge 1: Nuberu

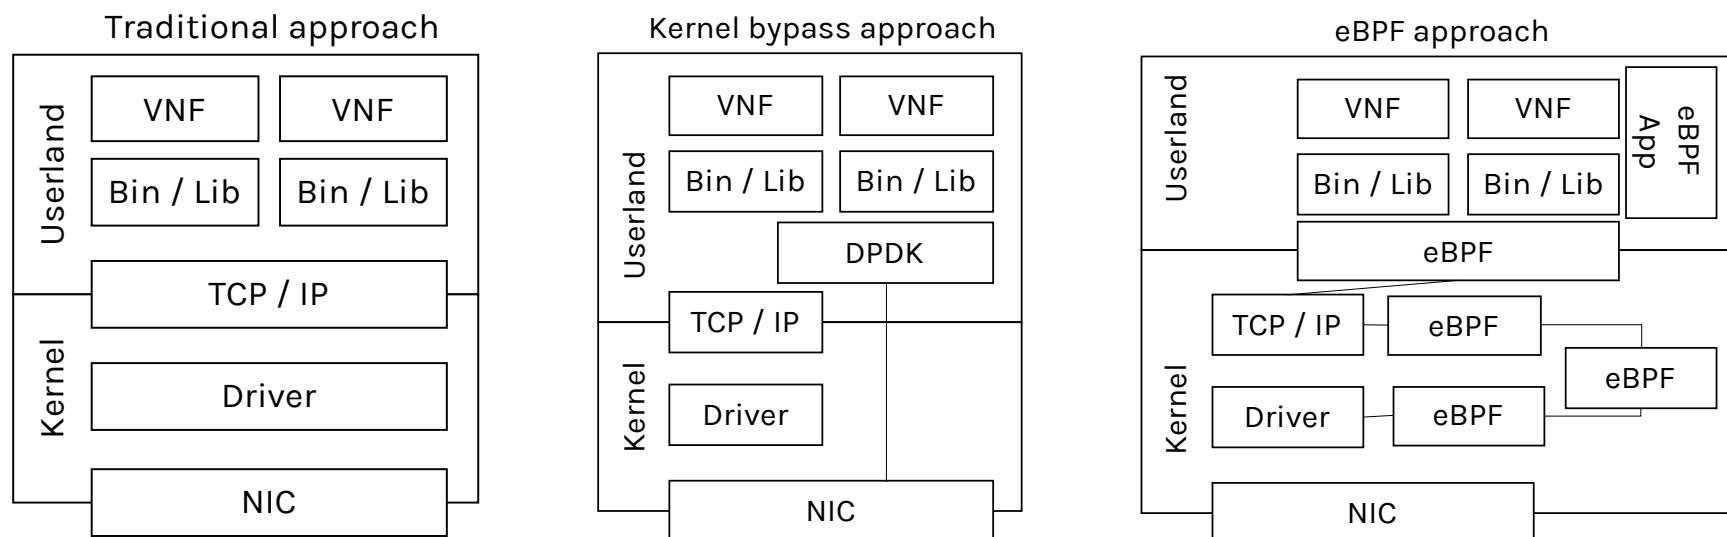

Challenges (2/3)

- Scalable interconnections
 - Traditional approach: slow
 - Kernel bypass: machine-dependent

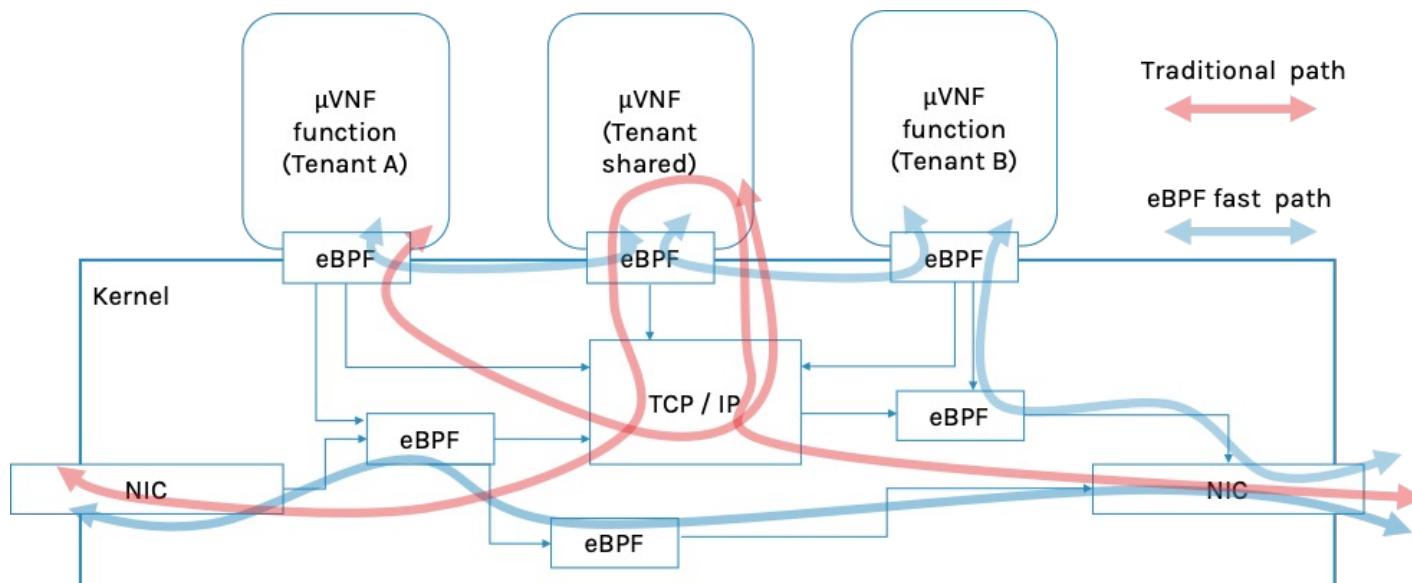

Challenges (2/3)

- Scalable interconnections
 - From iptables to eBPFs

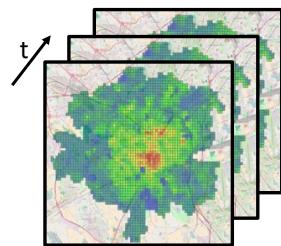

Challenges (2/3)

- Scalable interconnections
 - From iptables to eBPFs

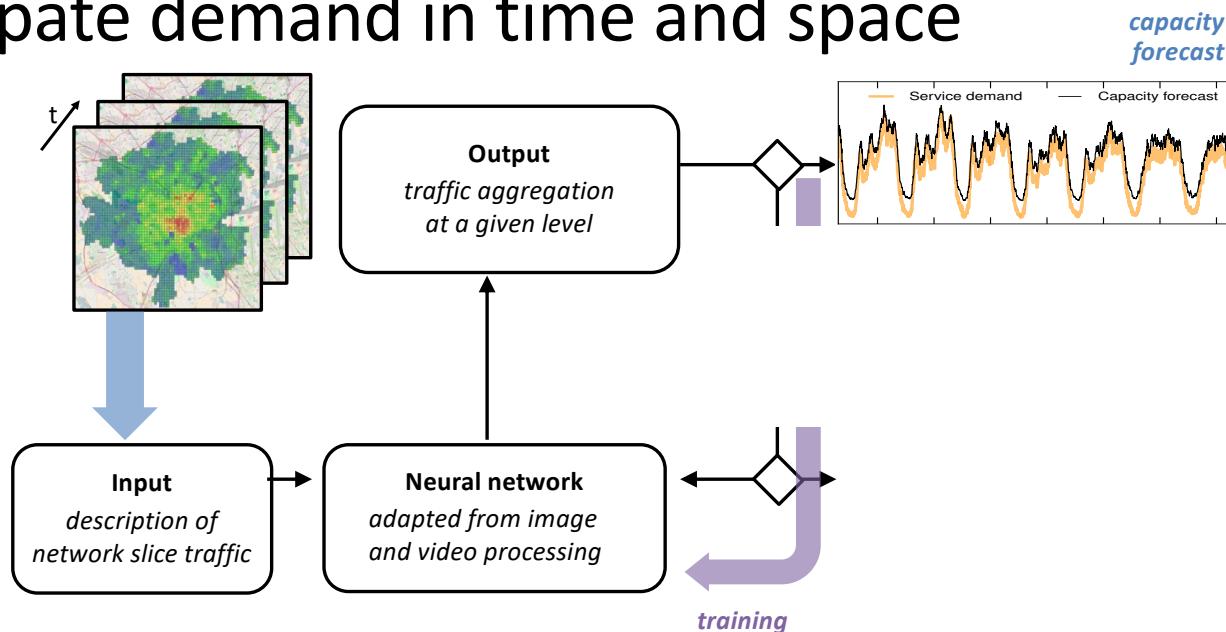

Challenges (3/3)

- Precise orchestration algorithms for functions
 - Anticipate demand in time and space

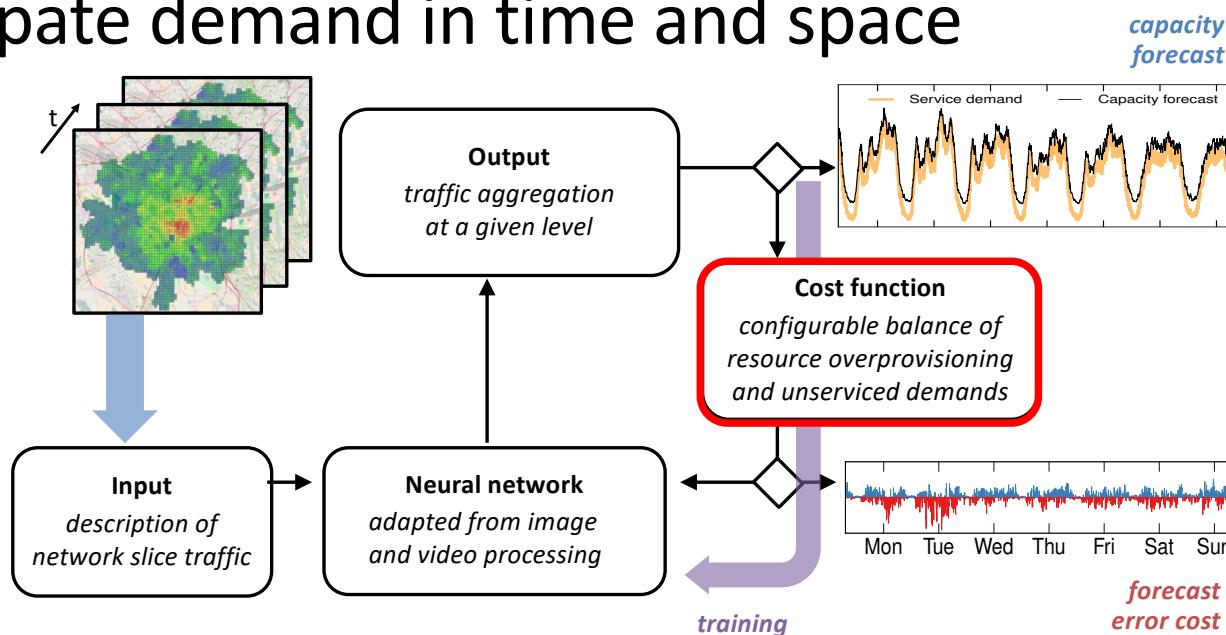

Challenges (3/3)

- Precise orchestration algorithms for functions
 - Anticipate demand in time and space

Challenges (3/3)

- Precise orchestration algorithms for functions
 - Anticipate demand in time and space

Wrap up

- Cloud computing is already embracing microservices and serverless, while mobile networking is lagging
 - There are reasons for this
- Three main challenges
 - Re design of VNFs
 - Efficient and scalable interconnections
 - Novel orchestration approaches

Acknowledgements

- All my great co-authors
- European Union's Horizon 2020 research and innovation programme under grant agreement no. 101015956 (Hexa-X).
- Spanish Ministry of Economic Affairs and Digital Transformation and the European Union-NextGenerationEU through the UNICO 5G I+D SORUS projects.
